

## Preserving the reliability of financial power

### IPU ClearTank tank cleaning service

## Clear Continuity

- Clean, dry fuel ensures generator reliability
- Fuel tanks can be cleaned without taking power offline
- ClearTank is safe - no man-entry is required
- ClearTank ensures the safety of *all* aspects of critical power

Call IPU's Fuel Conditioning Division on 0121 511 0400

Fuel contamination is one risk a bank's facilities manager shouldn't have to worry about.

**IPU Group's ClearTank service: clean tanks ▶ clean fuel ▶ clean power**

You need one thing from your standby and primary power systems: dependability. You need the assurance that they will function perfectly when and if they're needed.

Fuel storage is a potential point of failure that's easy to overlook. Your tanks can harbour contamination that pollutes any clean fuel they receive.

IPU Group's ClearTank tank cleaning service removes the contaminants from your tank and paves the way for a comprehensive fuel management programme.

Once complete, we certify that your tanks are clean and your fuel meets the 18/16/13 level of cleanliness as defined by ISO 4406:1999.

It's one less thing for you to worry about.

**Service with discretion**

The last thing you want to do is unsettle customers. While tank cleaning is a wise and prudent precautionary measure it can be misinterpreted.

IPU Group's ClearTank service works discretely from an unmarked van to avoid any negative connotations.

ClearTank addresses the main types of fuel contamination:

- Dissolved, emulsified and free water
- Solid particulates such as soot, rust, grit and colloid carbon.
- Microbial growths such as bacteria, mould, fungi and yeast (collectively known as the 'diesel bug').
- Sludge that has settled at the bottom of the tank
- Biofilms that form on the tank surfaces. These are often immune to standard fuel polishing techniques.

**Safe for you and safe for staff**

IPU Group's ClearTank service can, if necessary, clean your tanks while your generators are still running. There is no need to endanger the continuity of your power supply.

By working without needing to send a man into the toxic atmosphere of an empty fuel tank, we keep staff safe too.
